

WHAT MOVES GOLD

Four forces set the price of gold. Name them before you trade them.

Gold has no earnings and pays no dividend. Its price is set by what money elsewhere is doing. This snippet gives you the four drivers, what each one usually does to price, and how little of that you actually need on a chart.

⚠ Trading gold, forex and CFDs on margin carries a high level of risk and you could lose more than your initial deposit. 70–80% of retail investor accounts lose money when trading CFDs. Past performance is not indicative of future results. All content is for education only and is not financial advice.

THE FOUR HANDS ON GOLD

Gold is priced against the dollar, and the dollar is priced against everything else. That is why gold looks like it moves for no reason: the reason is usually somewhere other than gold.

Four drivers do most of the work. Learn the direction each one pushes and most days stop being a mystery.

DRIVER	WHEN IT RISES, GOLD USUALLY
US dollar strength	Falls
Real yields Interest rates minus inflation	Falls
Fear and risk-off flows	Rises
Central bank and physical demand Slow, structural	Rises

"Usually" is doing real work in that table. Two drivers often pull at once — a strong dollar in a frightened market, for example. Price follows the stronger hand, and you find out which one that is by watching price, not by ranking the news.

THE PRACTICAL VERSION

You do not need to forecast the drivers. You need to know which one is loud today, and where your level sits.

WHAT THAT LOOKS LIKE ON YOUR CHART

Gold trends hard and retraces hard. A session that covers 200–400 pips is ordinary, not exceptional, and the same distance that makes a target reachable makes a tight stop worthless.

The drivers arrive on a schedule. Inflation data, rate decisions and jobs numbers are printed at a known minute. Between releases, price respects levels. On release, it does not — that is the whole reason we hold a news lockout.

ORDINARY SESSION RANGE

200–400 pips

Reason a 20-pip stop dies

WHERE THE VOLUME SITS (MYT)

20:00–24:00

London–New York overlap

You cannot see positioning, order books or who is buying. You can see direction and you can see levels. That is the whole of Sam's angle: **ride the trend the big banks are already in**, at levels marked before the session opens, and stand aside when the calendar says the level will not hold.

WHAT THAT LEAVES YOU DOING

Mark your levels before the session. Trade in the direction price is already going.
Stand down when the calendar says so.

A driver you cannot measure is not a trade. A level you marked before the session is.

NEXT

THREE THINGS TO DO THIS WEEK

1. Mark the previous day's high and low before London opens. Two lines, nothing else.
2. Open an economic calendar and write down every high-impact US release for the week, in MYT.
3. Write one line on where the trend is. Not a forecast — a description.

WHERE THE SIGNALS LIVE

Setups with entry, stop and targets — and the losses — are published through the bot.
