

READING R

One unit of risk. Every result measured against it.

R is why a trader with a 45% win rate can be far ahead of one at 70%. It is also why every SamBangGold result is published in R and pips instead of a screenshot of a balance.

LENGTH	LEVEL	RECORD
4 pages	Beginner	Reviewed by Sam

⚠ Trading gold, forex and CFDs on margin carries a high level of risk and you could lose more than your initial deposit. 70–80% of retail investor accounts lose money when trading CFDs. Past performance is not indicative of future results. All content is for education only and is not financial advice.

WHAT R MEANS

R is the amount you decided to risk on the trade. Whatever that is for your account, it counts as one. A trade that hits its stop is $-1R$. A trade that runs two and a half times the stop distance in your favour is $+2.5R$.

That one substitution does three useful things at once.

WHAT YOU GAIN	WHY
Comparable	A 100-pip trade and a 400-pip trade can finally be measured on the same scale.
Portable	Results mean the same thing on any account size, so nobody has to show a balance.
Honest	A $-1R$ is a $-1R$. There is nowhere to hide it and no way to dress it up.

THE SENTENCE THAT MAKES TRADING CALM

Before every entry you already know your worst case: $-1R$, plus whatever slippage the market adds.

WIN RATE ON ITS OWN SAYS NOTHING

Three traders, twenty trades each, one unit of risk per trade. Every loser costs $-1R$. The only difference is the average size of the wins.

WIN RATE	AVERAGE WIN	AFTER 20 TRADES
70%	$+0.5R$	$+1.0R$
55%	$+1.5R$	$+7.5R$
45%	$+2.5R$	$+11.5R$

The trader who is right least often finishes furthest ahead. Nothing in that table is a promise — it is arithmetic, and it works in the other direction just as reliably. Cut the average win to $+0.4R$ at 45% and the same twenty trades finish negative.

Which is why **"68% win rate" on its own is marketing, not information**. Ask for the average R , the number of closed trades, and the largest losing run. All three are in the service record, including the runs nobody enjoys.

DRAWDOWN IS THE PRICE OF THE AVERAGE

A 45% win rate means runs of four or five losses arrive as normal weather. Size so that a $-5R$ stretch is survivable and boring, because it is coming.

NEXT

THREE THINGS TO DO THIS WEEK

1. Re-score your last twenty trades in R. Ignore the money column entirely.
2. Work out your average win in R and your longest losing run.
3. Ask of any track record you are shown — including ours — what the average R and the closed-trade count are.

WHERE THE SIGNALS LIVE

The service record is published in R and pips — wins, losses and the flat weeks.
