

⚠ Trading gold, forex and CFDs on margin carries a high level of risk and you could lose more than your initial deposit. 70–80% of retail investor accounts lose money when trading CFDs. Past performance is not indicative of future results. All content is for education only and is not financial advice.

PREMIUM TIER · FULL SOP · XAUUSD

GOLD RECRUIT MANUAL

Ten missions to finish before you press BUY on gold.

This book teaches you how to read the gold market, how to size risk, and how to follow orders with discipline. It promises no income. There is not one profit figure in currency anywhere in it — everything is in pips and R.

MISSIONS

3

PARTS

0

PROFIT PROMISES

TEN MISSIONS

PART I · MARKET BASICS

01	The Gold Market · what you are trading, and why the price moves	04
02	Candlestick · reading candlesticks with no indicators at all	06
03	Support & Resistance · price levels where the market has stopped before	08
04	Trend & Time Frame · market direction and three time frames	10

PART II · RISK & ORDERS

05	Order & Pending Order · order types, and why pending orders are better	13
06	Entry · SL · TP · three prices, and what 1R means	15
07	Money Management · position size, the 1% rule, drawdown maths	17

PART III · OPERATIONS

08	Trading Psychology · the four enemies inside your own head	20
09	Trading Plan & Journal · one page, news lockout, journal	22
10	Reading Sam's Signals · the signal card, opening an account, first trade	24

APPENDICES · SOP REFERENCE

A	Daily SOP · checklist for before, during and after the session	26
B	Quick reference card · formula, lot table, session times, news lockout	27
C	Glossary · every term used in this book	28

PART I

MARKET BASICS

Four missions to understand where you stand: what gold is, how price speaks, where it stops, and which way it is going. Not one order is opened yet.

01 THE GOLD MARKET

Objective: you know what you are trading, and why its price moves.

WHAT XAUUSD IS

XAU is the code for gold. USD is the US dollar. So XAUUSD means the price of one ounce of gold in dollars. When you BUY XAUUSD you are betting gold rises against the dollar. When you SELL, the opposite.

You do not own physical gold. No bar is delivered to your door. You trade a contract that tracks the gold price. One standard lot is 100 ounces, so a \$1.00 move per ounce moves your account 100 times that lot size. This is why position size is the most dangerous decision in this book — and why it has a mission of its own.

CAUTION · PIPS ON GOLD

Gold has no single agreed pip definition. Some brokers count 1 pip as a 0.10 move, others as 0.01. Do not guess. Open your broker's contract specification and write its definition in your trading journal. In this book distances are given in dollars per ounce and risk is given in R, so your maths is right whichever broker you use.

FIVE REASONS GOLD MOVES

- **Dollar strength.** Gold is priced in dollars. A strong dollar presses gold down; a weak dollar lifts it.
- **US interest rates.** Gold pays no interest. When rates are high, holding dollars is more attractive.
- **Inflation.** When money loses value, some investors move into gold as a store of value.
- **Fear.** War, banking trouble, geopolitical tension — gold takes the inflows.
- **Central bank buying.** Large flows, slow but heavy.

You do not need to forecast any of the five. You only need to know they exist, so you understand why gold can move fast for no reason visible on the chart. Sam rides the big banks' trend; he does not try to front-run them.

WHEN THIS MARKET IS AWAKE

Gold trades almost 24 hours a day, five days a week — but it is not the same market all day. The times below are Malaysian time (GMT+8) and shift by an hour when the US and Europe change to summer time.

SESSION	TIME MYT	CHARACTER
Asia	07:00–15:00	Narrow and slow. Plenty of false signals.
London	15:00–24:00	Direction starts to form. Volume arrives.
Overlap	20:30–24:00	London meets New York. The biggest moves, and the most news.

SIX TERMS, ONCE ONLY

Lot

Your position size. 1 lot = 100 ounces of gold. 0.01 lot = 1 ounce.

Spread

The gap between buy and sell price. Your cost on every entry. Gold is usually wider than currencies.

Leverage

Broker credit that lets a small deposit hold a large position. It magnifies profit and loss equally.

Margin

Money the broker holds to keep a position open. When margin runs out, your position is closed for you.

Swap

A daily charge or credit if a position is held overnight. Check your broker's gold swap rates.

Slippage

The gap between the price you asked for and the price you got. Worst around news.

02 CANDLESTICK

Objective: you can read a single candlestick, and know when it means anything.

Every candlestick represents one period of time — an hour, four hours, a day. It records four prices only: open, high, low and close. That is all. There is no forecast in it, only a record.

The body shows who won that period. The wicks show how far price went before being pushed back. The body tells you about the decision; the wick tells you about the rejection.

FIGURE 02.1 · CANDLESTICK ANATOMY. GREEN AND RED ONLY MARK DIRECTION.

THREE READINGS, ENOUGH TO START WITH

- 1 Long body, short wicks. One side controlled the period start to finish. If it points the same way as the trend, that is real pressure.
- 2 A long wick at one end. Price tried to go there and was rejected. A long lower wick sitting right on support means buyers defended that level.
- 3 A small candlestick after a big one. The market is holding its breath. Not an entry signal — a wait signal.

RULE 02

A candlestick in the middle of the chart means nothing. The same candlestick, right on support or resistance, means a great deal. Location first, candlestick second. That is why Mission 03 comes next.

DRILL 02 · FIFTEEN MINUTES A DAY

- 1 Open the XAUUSD chart on the H4 time frame.
- 2 Wait for one candlestick to close. Do nothing before it closes.
- 3 Write in your trading journal: body long or short, wick on which side.
- 4 Write one sentence: who won those four hours, buyers or sellers.
- 5 Repeat for ten days. You will start seeing patterns without any indicator.

03 *SUPPORT & RESISTANCE*

Objective: you can mark three important levels on a gold chart, and say why they matter.

Support is a level where buyers have won before — price fell to it and was pushed back up. Resistance is a level where sellers have won — price rose to it and was pushed back down.

Neither is a magic line. They are simply places where a lot of orders once piled up. When price returns, orders pile up again — until one day there are not enough, and the level breaks.

FIGURE 03.1 · PRICE WORKS BETWEEN TWO LEVELS UNTIL ONE OF THEM GIVES WAY.

HOW TO MARK A LEVEL, STEP BY STEP

- 01 Open the D1 time frame. Levels on the daily chart are respected far more than levels on a five-minute chart.
- 02 Find where price stopped at least twice. Once is not a level, it is a coincidence.
- 03 Mark it from the candlestick body, not the wick tip. Wicks overshoot.
- 04 Make it a zone, not a line. On gold, allow a few dollars per ounce. Price does not stop on tidy numbers.
- 05 Stop at three levels. A chart covered in lines means you chose nothing.

RULE 03 · BROKEN SUPPORT BECOMES RESISTANCE

When price breaks below support and comes back to touch it from underneath, the level swaps roles: it is now resistance. The same happens in reverse. An old level does not disappear — it changes sides.

04 TREND & TIME FRAME

Objective: you can state gold's direction in one sentence, with evidence from the chart.

An uptrend means price is making higher highs and higher lows. A downtrend means lower highs and lower lows. If you cannot point at two highs and two lows that fit the pattern, you do not have a trend — you have a chop.

The third state is the most common: sideways. Price moves flat between support and resistance with no direction. For a beginner, sideways means one thing only: no trade.

FIGURE 04.1 · THREE MARKET STATES. TWO OF THEM ARE TRADEABLE.

THREE TIME FRAMES

You do not pick one time frame. You use three, and each has exactly one job.

D1 · Daily

DIRECTION

Decides whether you are allowed to buy, sell, or wait.
Checked once a day.

H4 · Four hour

LEVELS

Decides where you enter and where the stop loss sits.
This is your main chart.

M15 · Fifteen minute

TIMING

Only for confirming the moment of entry. Never look for direction here — it is too noisy.

RULE 04

If D1 and H4 disagree, you do not have a trade. Not a small trade, not a careful trade — none. Waiting is a legitimate position.

PART II

RISK & ORDERS

Three missions on mechanics: how to send an order, how to set entry, stop loss and take profit before you enter, and how to size the position. Mission 07 is the most important mission in this book.

05 ORDER & PENDING ORDER

Objective: you can place an order before price arrives, not after you panic.

A market order enters now, at the current price. It is easy, and it is the most common way beginners wreck an account — because the decision is made while price is moving and the heart is pounding.

A pending order is placed at a level you chose in advance, and only activates when price gets there. You set it while calm, with the stop loss and take profit attached. The market comes to you; you do not chase it.

PENDING ORDER	PLACED	YOU EXPECT
Buy Limit	Below current price	Price falls to support, then bounces up
Buy Stop	Above current price	Resistance breakout, price continues up
Sell Limit	Above current price	Price rises to resistance, then is pushed down
Sell Stop	Below current price	Support breakdown, price continues down

The simplest way to remember it: Limit expects a bounce, Stop expects a breakout.

PLACING A PENDING ORDER

-
- 01 Establish direction on D1. If there is no direction, stop here.
-
- 02 On H4, pick one of the three support and resistance levels you marked in Mission 03.
-
- 03 Write the three prices on paper first: entry, stop loss, take profit. Press nothing yet.
-
- 04 Calculate position size using the method in Mission 07. If it comes out below your broker's minimum lot, the trade does not exist.
-
- 05 Send the pending order with the stop loss and take profit attached. Never leave the stop loss for "later".
-
- 06 Close the platform. A pending order does not need watching.
-

RULE 05

Any order without a stop loss is a mistake, not a strategy. If your platform lets you enter without one, that is a platform problem — not permission to try.

06 ENTRY - SL - TP

Objective: you can state every trade in R, not in currency.

Every trade has three prices: entry, stop loss (the exit if you are wrong), and take profit (the exit if you are right). All three are set before the position opens. After that, your job is to wait.

The distance between entry and stop loss is 1R — one unit of risk. Everything else is measured against it. A take profit at twice that distance is 2R. If the stop loss is hit, you lose 1R. That is the whole vocabulary you need, and it is why this book never speaks in currency.

+4R	2 401.00	TP2
+2R	2 393.00	TP1
0R	2 385.00	Entry
-1R	2 381.00	Stop loss

FIGURE 06.1 · ENTRY TO STOP LOSS IS \$4.00 PER OUNCE. THAT IS 1R. EVERY TAKE PROFIT IS A MULTIPLE OF IT.

WHY 1:2 RISK-REWARD IS THE MINIMUM

If your take profit is twice the stop distance, you can be wrong more often than right and still move forward. This is not motivation; it is arithmetic. Look at ten trades at 1:3, with only four of them winning:

4 wins × +3R	+12R
6 losses × -1R	-6R
Net after 10 trades	+6R

A 40% win rate, still ahead. Reverse the ratio — stop loss further away than the take profit — and even a 60% win rate can kill an account. This is the only piece of maths you need to memorise.

WHAT YOU CONTROL

The stop distance, the target distance, the position size, and whether you enter at all.

WHAT YOU DO NOT CONTROL

Whether this trade wins. That is why the count is over fifty trades, not one.

07 *MONEY MANAGEMENT*

Objective: you can calculate position size yourself, and you know how long your account can survive.

Risk on every trade is 1% of the account balance. That is your 1R. Not 1% of expected profit — 1% you are prepared to lose entirely, today, without it changing your mood.

Position size is not a matter of feel. It is decided by the stop distance. A far stop means a small lot. A near stop allows a bigger one. The risk stays the same; only the lot changes.

QUICK REFERENCE TABLE

Lots per 1,000 units of account balance, at 1% risk. Multiply by your balance divided by 1,000.

STOP DISTANCE	LOTS / 1,000 BALANCE	RISK
\$3.00	0.03	1R
\$5.00	0.02	1R
\$10.00	0.01	1R
\$20.00	0.005	1R

Look at the last row. If the correct size is smaller than your broker's minimum lot, the answer is not "round up". The answer is that the trade is too big for your account, and you let it go.

DRAWDOWN MATHS

5 losses in a row at 1%	-4.9%
10 losses in a row at 1%	-9.6%
10 losses in a row at 10%	-65.1%

Ten losses in a row will happen to you one day. At 1% risk it is a bad month. At 10% risk it is the end. The 1% rule is not about profit — it is about still having an account to trade next week.

CAUTION · MARTINGALE

Doubling position size after a loss to “win it back” is called martingale. It appears to work ten times, then erases the account on the eleventh. If you change position size because of the previous trade, you have left money management behind.

PART III

OPERATIONS

The last three missions: your own head, your own system, and how to read a SamBangGold signal without handing your risk decision to someone else.

08 *TRADING PSYCHOLOGY*

Objective: you can name the four ways your own head will try to break your rules.

Technique can be learned in a month. Discipline takes longer, because your opponent is not the market — it is yourself after three losses in a row. The four enemies below account for almost every lost account.

REVENGE TRADE

Re-entering immediately after a stop loss, to “win it back”. This trade is not in your trading plan. It is revenge, not a setup.

FOMO

Entering late because you fear missing a big move. You enter furthest from the stop loss, so the risk is at its worst.

OVERTRADE

Eight trades a day out of boredom. Setup quality drops every time you lower the standard to fill time.

MOVING THE STOP

Widening the stop loss so the trade “has room”. This turns a controlled 1R loss into an unknown one.

DO THIS, NOT THAT

SITUATION	THE RIGHT MOVE	WHAT WRECKS ACCOUNTS
After a stop loss is hit	Close the platform, log it in the journal	Re-enter immediately to win it back
Price has run from the entry	Let the trade go	Enter at a worse price
The trade moves against you	Leave the stop loss where it is	Widen the stop loss a little
Three wins in a row	Risk size stays at 1%	Raise the lot because you are hot
No setup that day	No trade. Close the chart	Lower the standard so there is a trade

BEFORE THE TRADE

1. Do D1 and H4 agree on direction?
2. No major news within 30 minutes?
3. Position size calculated, not guessed?

AFTER THE TRADE

1. Record the result in R, not in currency.
2. Note whether you followed the plan.
3. Close the platform until the next session.

RULE 08 · LOSSES GET PUBLISHED

A trade that followed the plan and lost 1R is a good trade. A trade that broke the plan and won is a bad one — it teaches a habit that will kill the account later. Judge yourself on compliance, not on outcome. SamBangGold publishes its losses for the same reason: a record that hides the -1R trades cannot be trusted.

09 *TRADING PLAN & JOURNAL*

Objective: you have one page that decides for you, and one record that improves it.

A trading plan is not an essay. It is seven lines you can answer yes or no before every trade. If your plan runs longer than one page, you will not read it while price is moving.

News lockout. Gold moves most violently on US data. Spreads widen, slippage rises, and a stop loss can be hit at a price unrelated to your analysis. The rule is simple: no new entries 30 minutes before and 30 minutes after a high-impact release.

FIGURE 09.1 · POSITIONS ALREADY OPEN ARE LEFT WITH THEIR ORIGINAL STOP LOSS. ONLY NEW ENTRIES ARE BLOCKED.

TRADING JOURNAL - SIX COLUMNS

One row per trade. Six columns, no more — a complicated journal never gets filled in.

DATE	SIDE	SETUP	RESULT	FOLLOWED PLAN	NOTES
12/03	BUY	H4 support bounce	+2.0R	✓	Exited at TP1, correct
13/03	SELL	Breakout, entered late	-1.0R	—	FOMO. Not my setup.

EVERY WEEKEND · THREE QUESTIONS

How many trades followed the plan?

Which mistake repeated?

What one thing do I fix next week?

10 *READING SAM'S SIGNALS*

Objective: you can take a signal and run it at your own risk size.

XAUUSD · INTRADAY

SAMPLE BUY

ENTRY

STOP

TP1-3

2 385 .00

2 381 .00

2 393 · 2 401 · 2 409

News lockout · no new entries 30 minutes either side

- 1 **Instrument and side.** If it does not agree with the D1 direction you see yourself, you may let it go. A signal is not an order.
- 2 **Entry.** The planned price. If price has already run far from it, that trade is over — do not enter at a worse price.
- 3 **Stop loss.** The most important number on the card. Entry to stop loss is the basis of your position size calculation.
- 4 **TP1, TP2, TP3.** Staged take profits. Beginners take TP1 in full first; the ladder is for later.
- 5 **Position size.** Not on the card, and it should not be. It depends on your balance. You calculate it yourself, using Mission 07.
- 6 **Status and R result.** Once closed, the card shows the result in R — including the -1R ones.

RULE 10

A signal gives you three prices. The risk decision stays yours, and cannot be handed to anyone. If the correct position size makes no sense for your account, the answer is to skip the trade.

CHOOSING A BROKER

Four things to check before you deposit money, and not one of them is a deposit bonus.

REGULATION

Who regulates the broker, and in which country. Check the licence number on the regulator's site, not the broker's.

GOLD SPREAD

Compare the XAUUSD spread during busy hours, not the marketing figure from a quiet one.

MINIMUM LOT SIZE

A small minimum lot is what lets you obey the 1% rule on a small account.

WITHDRAWALS

Make one small withdrawal in the first month. A broker that makes withdrawals difficult is one you leave early.

YOUR FIRST TRADE

- 1 Demo account, 20 trades, following the trading plan completely. Count R on each one.
- 2 Check the journal: how many of the 20 followed the plan? If fewer than 17, repeat.
- 3 Open a live account and fund it with an amount you can genuinely afford to lose.
- 4 Risk 1% — and for the first ten trades, use 0.5%.
- 5 Maximum one open position until you have 50 live trades in the journal.
- 6 After 50 trades, review: plan compliance, average R, repeated mistakes. Only then increase size.

A DAILY SOP

If one box cannot be ticked, the session is over. No trade is a complete decision.

1 · BEFORE THE SESSION

- ☐ D1 direction written down: up, down, or sideways.
- ☐ Three support and resistance levels marked on H4.
- ☐ News calendar checked. Lockout windows written down.
- ☐ Account balance noted, 1% risk calculated for today.

2 · BEFORE SENDING THE ORDER

- ☐ D1 and H4 agree with this trade's direction.
- ☐ Entry sits at one of the three marked levels.
- ☐ Stop loss and take profit have numbers. Risk-reward at least 1:2.
- ☐ Position size calculated from the stop distance, rounded down.
- ☐ Outside the news lockout window.

3 · AFTER THE TRADE CLOSES

- ☐ Result recorded in R, not in currency.
- ☐ The "followed plan" column marked ✓ or —, separately from profit or loss.
- ☐ Platform closed until the next session.
- ☐ Two losses today means the session is over.

B QUICK REFERENCE CARD

Every operating number in this book, in one place.

LOTS / 1,000 BALANCE · 1% RISK

SL \$3.00 0.03

SL \$5.00 0.02

Asia 07:00–15:00

London 15:00–24:00

Overlap 20:30–24:00

News lockout -30 / +30 min

OPERATING LIMITS

Risk per trade 1%

First 10 trades 0.5%

Max open positions 1–2

Stop for the day 2 losses

C GLOSSARY

Every term used in this book, so you can look any of them up on any platform.

Support

A level where buyers have previously stopped price falling.

Resistance

A level where sellers have previously stopped price rising.

Candlestick

One block of price for one period: open, high, low, close.

Body

The thick part of a candlestick: open to close.

Wick

The thin line above or below the body: a price tried and rejected.

Time frame

The period one candlestick covers. D1, H4, M15.

Higher high

A new high above the previous high. A sign of an uptrend.

Sideways

A market with no direction, moving flat between two levels.

Breakout

Price breaks a level and keeps moving that way.

Pending order

An order placed in advance that only activates when price reaches that level.

Entry

The planned entry price.

Stop loss

The automatic exit when your analysis is wrong. Its distance = 1R.

Take profit

The automatic exit when your analysis is right.

R

One unit of risk. +2R means twice the stop distance in profit.

Risk-reward

The ratio of stop distance to take profit distance.

Drawdown

The fall in account balance from its highest point.

Spread

The gap between buy and sell price. A cost on every entry.

News lockout

The 30 minutes either side of a major release: no new entries.

SAM DOES NOT SPEAK

Nothing in this book promises you anything. It teaches four things: read direction, mark levels, size risk, and record everything. The rest is repetition — the same formula, a thousand times, with the same discipline on the thousandth trade as on the first.

The losses will come. They get published, counted in R, and moved past. That is the whole difference between a trader and a gambler.

THE CHANNEL

Gold setups, published with the losses.
